Art Unit: 3721

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The phrase "measuring the operation", in claims 1 and 3, is vague and indefinite, because it is unclear what is being measured?

The phrase "control strategies", in claims 1 and 3, is vague and indefinite, because it is unclear what are the metes and bounds of the control strategies?

The phrase "prioritized control is weighted", in claims 1 and 3, is vague and indefinite, because it is unclear what is the claim limitation? Moreover, when one prioritized a task one weighted one task over the other, thus the phrase "prioritized control is weighted" is redundant.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1 and 3 are rejected under 35 U.S.C. 102(b) as being anticipated by Rogers et al. (4,195,699).

Rogers discloses a method and an apparatus comprising:

a control unit 20 provided with a user interface 36 for controlling the drilling;

at least one sensor 16, 18 for measuring drill operation; and

the operating system is provided with at least two simultaneously active preformed control modes (column 2, lines 2-4) with different control strategies, and each control mode determines at least one criterion to be measured during the drilling, a threshold value for a measurement result, and at least one adjustable operating parameter (column 2, lines 5-13);

one control mode can be prioritized over the other modes; and the control unit is arranged to automatically adjust, based on the measurement results, the operating parameters determined by the control modes such that the drilling result according to the prioritized control mode is weighted over the other control modes (column 2, lines 67-68 and column 3, lines 1-5).

The recitation "for a rock drilling apparatus", in claim 3, that comprising: a carrier, a feeding beam, and a rock drill is being treated as the preamble of the claim that claimed a control system, and therefore the rock drilling apparatus is not being considered as part of the claim limitation. Moreover, the control system as recited in claim 3 can be used to control other drilling apparatus.

Art Unit: 3721

Alternatively, the following 103 rejection is made in the event that the Applicant amends claim 3 as a combination of a control system and a rock drilling apparatus.

Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 1 and 3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rogers et al. (4,195,699) in view of Tuunanen (5,934,387).

Rogers discloses a method and an apparatus comprising:

a control unit 20 provided with a user interface 36 for controlling the drilling;

at least one sensor 16, 18 for measuring drill operation; and

the operating system is provided with at least two simultaneously active preformed control modes (column 2, lines 2-4) with different control strategies, and each control mode determines at least one criterion to be measured during the drilling, a threshold value for a measurement result, and at least one adjustable operating parameter (column 2, lines 5-13);

one control mode can be prioritized over the other modes; and the control unit is arranged to automatically adjust, based on the measurement results, the operating parameters determined by the control modes such that the drilling

Art Unit: 3721

result according to the prioritized control mode is weighted over the other control modes (column 2, lines 67-68 and column 3, lines 1-5).

Rogers discloses the claimed invention, but does not expressly disclose a carrier; a feeding beam, and a rock drill.

Tuunanen discloses a method and an apparatus comprising: a carrier 1, a feeding beam 3 (a-c), and a rock drill 4 (a-c) movable with respect to the feeding beam (figure 1). Tuunanen apparatus provides a highly effective automatic drilling equipments. Therefore, it would have been obvious to one having ordinary skill in the art, at the time applicant's invention was made, to have modified Rogers method and apparatus by incorporating the drilling equipments as taught by Tuunanen to provide a effective automatic drilling equipments.

7. Claims 2 and 4-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Rogers et al. (4,195,699) in view of Tuunanen (5,934,387) and further in view of Osga (5,757,358).

As discussed above in paragraph 4 of this action, the modified method and apparatus of Rogers discloses the claimed invention, but does not expressly disclose the user interface system as recited in claims 2 and 4-7.

Osga discloses a method and apparatus that comprising a user interface control system in which the user employs the control cursor in the operating area to manipulate the control function. The computer (figure 1) will determine the x and y coordinates of the objects with respect to the cursor center location (column 4, lines15-21). Osga method and apparatus allows user to make

Art Unit: 3721

selection thru user interface control system and the computer will calculate the result base on the selection.

Therefore, it would have been obvious to one having ordinary skill in the art, at the time applicant's invention was made, to have modified Rogers method and apparatus by incorporating the user interface control system as taught by Osga providing an effective automatic control system.

Conclusion

- 8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
- 9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Thanh K Truong whose telephone number is (571) 272-4472. The examiner can normally be reached on Mon-Thurs from 8:00 AM to 6:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rinaldi I Rada can be reached on (571) 272-4467. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
